About Me — Adhokshaja Nagarhalli

I am Adhokshaja Nagarhalli, an aspiring AI Product Manager with an academic background in computer science, data science, artificial intelligence, and business management. I hold a B.Sc. in Computer Science and an M.Sc. in Data Science and Artificial Intelligence from REVA University. I am currently pursuing an MBA in Marketing at Jain University's CMS Business School, alongside an executive program in AI Product Management from the Indian School of Business. This combination reflects my interest in understanding how technology works, what customers need, and how businesses can turn ideas into useful products.

During my internship as a Partner Solutions Engineer at SentinelOne, I gained practical exposure to cybersecurity, cloud infrastructure, and partner enablement. My work included deploying SentinelOne agents across AWS environments such as EC2, ECS Fargate, and EKS, using CloudFormation and Helm-based deployment approaches. I also contributed to a lab covering 12 MITRE-mapped attack scenarios, supported product demonstrations, and prepared technical documentation and runbooks. These experiences strengthened my ability to investigate technical problems, explain solutions clearly, and connect product capabilities with customer requirements.

My internship also introduced me to log ingestion pipelines through Observo AI and automation workflows for partners. Working with technical teams and participating in enablement sessions helped me develop my communication, presentation, and collaboration skills. One of my most valuable learnings was that technical knowledge becomes more useful when it can be translated into a clear explanation of the problem being solved and the value delivered.

Beyond my academic and internship experience, I build projects to deepen my understanding of AI applications and data systems. My project work includes a retrieval-augmented generation application, a multilingual AI assistant, a product recommendation chatbot, and a flight operations data pipeline. Through these projects, I have explored Python, language models, vector databases, cloud platforms, and data engineering workflows. Building and troubleshooting applications has taught me to work through errors patiently, test assumptions, and improve solutions through iteration.

My career goal is to work in AI Product Management, bringing together technical understanding, customer insight, and business judgment. I am particularly interested in identifying meaningful problems, defining product requirements, and collaborating with engineering and business teams to build practical solutions. My background also draws me toward opportunities in Solutions Engineering, Product Analytics, and applied AI.

I approach learning with curiosity and a willingness to take on unfamiliar challenges. Whether I am deploying a cloud workload, preparing a presentation, or debugging an application, I aim to understand the reasoning behind the work. I want to build a career in which I can keep learning while contributing to technology products that solve real problems and deliver measurable value.
